

15. Design a C program to organize the file using two level directory structure.

Code:

```
main.c
1
2 #include <stdio.h>
3
4 int main() {
5     int users, files;
6
7     printf("Enter number of users: ");
8     scanf("%d",&users);
9
10    for(int i=0;i<users;i++) {
11        printf("\nUser %d\n",i+1);
12
13        printf("Enter number of files: ");
14        scanf("%d",&files);
15
16        char fname[20];
17
18        for(int j=0;j<files;j++) {
19            printf("Enter file name: ");
20            scanf("%s",fname);
21            printf("Stored %s in User %d Directory\n",fname,i+1);
22        }
23    }
24
25    return 0;
26 }
```

Output:

```
Output
Enter number of users: 2

User 1
Enter number of files: 2
Enter file name: a.text
Stored a.text in User 1 Directory
Enter file name: b.text
Stored b.text in User 1 Directory

User 2
Enter number of files: 1
Enter file name: c.text
Stored c.text in User 2 Directory

=== Code Execution Successful ===
```
